

Clinician.

The entity that supplies the test capability, the digital therapeutic, or the integration layer that brings device-side data to NHS care pathways. One role across the portfolio, three named institutions filling it — one per product.

Joe

HomeTest supplier · HIV / CVKM, PSA-AS, HbA1c

Provides the kit, dispatch, lab analysis and result return for HomeTest configurations. Operating model varies per configuration: all-inclusive black-box for HIV; split or pathology-led shapes for PSA-AS and HbA1c remain in scope but not yet committed.

OPEN JOE'S PERSONA →

Marcus

HealthStore supplier · DTx founder

DTx founder whose product is admitted to the National App Formulary and prescribed through the HealthStore route. Operating relationship runs through formulary admission, evidence requirements and pricing architecture rather than a per-kit dispatch model.

OPEN MARCUS'S PERSONA →

Tariq

HealthSync supplier · Integration partner

Integration partner who supplies the wearable hardware, the data stream and the integration layer that brings device-side data into NHS care pathways. Earliest stage of the three workstreams; operating shape will firm up as configurations land.

About this role

Suppliers are the institutions that deliver the capability the platform routes to. The role threads through every product, but the institution and the operating model behind it vary per product.

HomeTest needs a supplier (or supplier consortium) that can dispatch kits to patients' homes, analyse samples in an accredited lab, and return results through the platform. **Joe** is the archetype. The supplier model varies by configuration: all-inclusive black-box (kit plus lab plus result through one supplier); split (logistics supplier plus specialist lab as separate suppliers); pathology-led (NHS pathology lab anchors the chain, others wrap around). The black-box shape is the working assumption for HIV; PSA-AS and HbA1c shapes will firm up as those configurations approach commissioning.

HealthStore needs a supplier that holds the digital therapeutic product itself: the founder or sponsor whose product is admitted to the National App Formulary and prescribed through the HealthStore route. **Marcus** is the archetype. The operating relationship runs through formulary admission, evidence requirements and pricing architecture rather than a per-kit dispatch model. Different commercial shape; same role.

HealthSync needs a supplier that brings device-side data into NHS care pathways: the integration partner who supplies the wearable hardware, the data stream and the integration layer. **Tariq** is the archetype. Earliest stage of the three; operating shape will firm up as configurations land.

This role is distinct from **David** (NHS Commercial), who sits in the universal hub as the central commercial framework holder. David shapes the framework, vehicle and pricing architecture that suppliers compete inside. Joe, Marcus and Tariq sit on the receiving side of that framework, configuring their offers to the NHSE rules of engagement.

WHY ONE ROLE, THREE PERSONAS The four central platform roles (Aisha clinical /

CSG, Priya NHSE Platform, David NHS Commercial, Ngozi IG) are universal in person:

one person each, identical across every product. The Supplier role is different. The

institution that supplies a given product varies (test supplier for HomeTest, DTx

founder for HealthStore, integration partner for HealthSync), so the cast is one

named persona per product. **Joe is the HomeTest supplier archetype;**

Marcus is the HealthStore supplier archetype; Tariq is the HealthSync

supplier archetype.

DTx Operating Model · Cast · Role archetype · Supplier. The body-that-supplies role; the institution behind it varies per

product. Distinct from David (platform-level commercial framework) who sits in the universal hub.
